

ST10384670

Name: Zanenhlanhla. Tshenolo. Konjwayo

Module: CLOUD DEVELOPMENT A

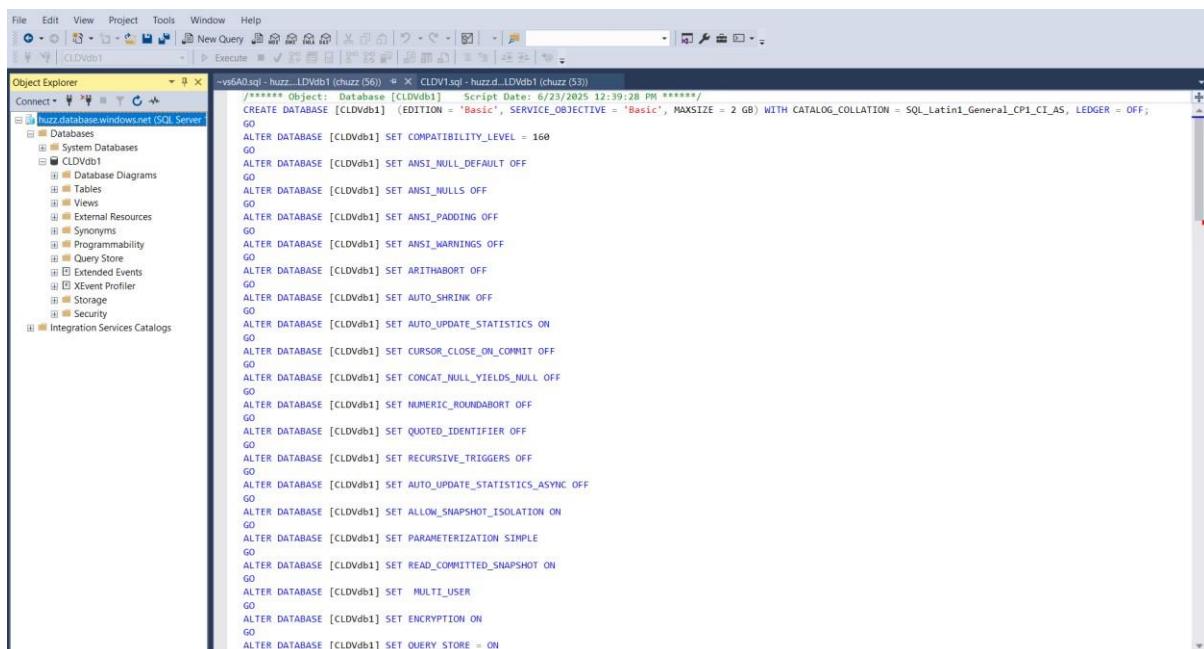

Component Discussion Technology Choices and Reasons

ASP.NET Core MVC

Because of its scalability, resilience, and close connection with Azure services, ASP.NET Core MVC was selected. It makes it possible for Models, Views, and Controllers to have their concerns clearly separated, which aids in logical system organization.

SQL Server

Because of its dependability, native cloud compatibility, and smooth Entity Framework integration, SQL Server was chosen. A scalable, cloud-hosted system that accommodates relational data and foreign key constraints was made possible by the use of Azure SQL Database.

The screenshot shows the SQL Server Management Studio (SSMS) interface. The Object Explorer on the left shows a connection to 'huzz.database.windows.net (SQL Server)' with a database named 'CLDVdb1'. The query window on the right displays a T-SQL script for creating a database named 'CLDVdb1'. The script includes standard database creation options like EDITION = 'Basic', SERVICE_OBJECTIVE = 'Basic', MAXSIZE = 2 GB, and CATALOG_COLLATION = SQL_Latin1_General_CI_AS, along with various ALTER DATABASE commands to set various compatibility options to OFF or ON.

```
-->sys5A0.sql - huzz...LDWb1 (chuzz (56)) - X CLDV1.sql - huzz.d...LDWb1 (chuzz (53))
***** Object: Database [CLDVdb1] Script Date: 6/23/2025 13:39:38 PM *****/
CREATE DATABASE [CLDVdb1] (EDITION = 'Basic', SERVICE_OBJECTIVE = 'Basic', MAXSIZE = 2 GB) WITH CATALOG_COLLATION = SQL_Latin1_General_CI_AS, LEDGER = OFF;
GO
ALTER DATABASE [CLDVdb1] SET COMPATIBILITY_LEVEL = 160
GO
ALTER DATABASE [CLDVdb1] SET ANSI_NULL_DEFAULT OFF
GO
ALTER DATABASE [CLDVdb1] SET ANSI_NULLS OFF
GO
ALTER DATABASE [CLDVdb1] SET ANSI_PADDING OFF
GO
ALTER DATABASE [CLDVdb1] SET ANSI_WARNINGS OFF
GO
ALTER DATABASE [CLDVdb1] SET ARITHABORT OFF
GO
ALTER DATABASE [CLDVdb1] SET AUTO_SHRINK OFF
GO
ALTER DATABASE [CLDVdb1] SET AUTO_UPDATE_STATISTICS ON
GO
ALTER DATABASE [CLDVdb1] SET CURSOR_CLOSE_ON_COMMIT OFF
GO
ALTER DATABASE [CLDVdb1] SET CONCAT_NULL_YIELDS_NULL OFF
GO
ALTER DATABASE [CLDVdb1] SET NUMERIC_ROUNDABORT OFF
GO
ALTER DATABASE [CLDVdb1] SET QUOTED_IDENTIFIER OFF
GO
ALTER DATABASE [CLDVdb1] SET RECURSIVE_TRIGGERS OFF
GO
ALTER DATABASE [CLDVdb1] SET AUTO_UPDATE_STATISTICS_ASYNC OFF
GO
ALTER DATABASE [CLDVdb1] SET ALLOW_SNAPSHOT_ISOLATION ON
GO
ALTER DATABASE [CLDVdb1] SET PARAMETERIZATION SIMPLE
GO
ALTER DATABASE [CLDVdb1] SET READ_COMMITTED_SNAPSHOT ON
GO
ALTER DATABASE [CLDVdb1] SET MULTI_USER
GO
ALTER DATABASE [CLDVdb1] SET ENCRYPTION ON
GO
ALTER DATABASE [CLDVdb1] SET QUERY_STORE = ON
```

Sql data base

Azure Blob Storage

Because Azure Blob Storage is very scalable and perfect for storing huge binary things like venue and event photographs, it was used to manage images. It also facilitates safe storage and speedy retrieval.

The screenshot shows the Microsoft Azure portal interface for managing blobs in a container named 'images'. The top navigation bar includes 'Microsoft Azure', 'Search resources, services, and docs (G+)', 'Copilot', and 'ADVTECH LTD (ADVTECHONLINE...)'. The main area displays a list of blobs with columns for Name, Modified, Access tier, Archive status, Blob type, Size, and Lease state. Each blob entry includes a preview thumbnail, a download icon, and a three-dot menu. A search bar at the top allows filtering by prefix, and a 'Show deleted blobs' toggle is present. The bottom of the screen shows the Windows taskbar with various pinned icons and the system tray indicating the date and time as 6/23/2025, 10:01 PM.

Name	Modified	Access tier	Archive status	Blob type	Size	Lease state

EF Core

ORM mapping was done with EF Core, which allowed for effective communication with the Azure SQL Database using LINQ queries and strongly typed C# classes. It made CRUD and database administration easier.

The Azure App Service

The web application was deployed in the cloud using the Azure App Service, which enables seamless scaling, continuous deployment, and direct GitHub connection for modifications in the future.

HTML and Bootstrap

A responsive and aesthetically pleasing front-end was developed using HTML and Bootstrap, while ASP.NET MVC's Razor Views enabled dynamic content rendering.

Alternative Elements (Taken into Account)

Database storage might have been done with Firebase or MongoDB Atlas, but unlike Azure SQL, they do not natively enforce relational fidelity.

Although Azure Blob Storage offered superior interoperability with the rest of the Azure ecosystem, Amazon S3 could have been utilized for picture storage.

Although they would have required more API levels and would have overcomplicated the project scope, Angular or React might have been utilized for the front end.

Reflection on the Project

Throughout my academic career, this cloud development project has been one of the most rewarding and challenging experiences I've had.

I lost the complete submission in Part 1 since I had trouble integrating GitHub and was unable to push my code in time. This was really discouraging, but I used it as a lesson rather than abandoning up.

Part 2 presented yet another set of challenges. Although I was able to get the system to function, my solution did not adhere to the rubric's requirements. Important aspects like adequate image storage and thorough validation were absent from my implementation. I came to the realization that in order to create a workable solution, I needed to focus more on the details and fully comprehend the rubric's requirements.

I made a self-promise that this would be my comeback when I got to Part 3. I pushed myself to create a completely working, cohesive solution by taking all of the criticism, errors, and frustrations from the preceding sections. I concentrated on:

- .being aware of the connections between the models.
- .enhancing my ability to handle errors.
- .Understanding Azure deployment procedures to guarantee a functional system.

Along the process, I ran into a number of technical blunders, including SQL migration issues, mismatched model relationships, and foreign key concerns. However, I persevered this time. I investigated, debugged, and improved the application until it performed as I had anticipated.

Throughout this project, I encountered several **technical difficulties** that impacted my progress but also helped me grow significantly as a developer.

Deployment Issues:

One of the biggest problems I faced was **deploying the web app to Azure**. I struggled with setting up the correct Azure App Service configuration, and the web application did not work on the internet initially. It took time to understand how to troubleshoot deployment logs, adjust the publish profile, and link the correct database to the live system. Eventually, I was able to get the app running online, but this part taught me that deployment requires a different set of skills beyond just writing code.

Database/Table Challenges:

I also had issues with **creating and managing the SQL database tables**. At first, my table structure didn't support the filtering logic correctly — especially when it came to adding fields for venue availability and handling the date range. I had to go back and make several changes to the database schema, update my Entity Framework migrations, and ensure the data was correctly seeded or entered to test the features. It was a frustrating but important learning experience in designing database systems that match real user requirements.

Runtime Errors & Debugging:

Another major challenge was dealing with **runtime errors**. During development, my application crashed several times due to incorrect logic, null reference errors, or configuration mismatches. Debugging these errors, especially in a cloud environment, was difficult at first. However, I learned how to use Visual Studio's debugging tools more effectively and how to check error messages in Azure's logs. Each error helped me get better at solving problems quickly and understanding how different parts of the application interact.

By facing and overcoming these issues, I developed stronger **problem-solving, debugging, and cloud deployment skills**. I learned that creating a functional cloud-based application takes much more than just writing code—it also requires patience, testing, and the ability to adapt when things don't work as expected.

Knowledge Acquired

.Making a plan is important. I learned to always test my deployment processes before committing to them after missing out on Part 1's GitHub submission.

.Take note of the rubric. It's important to design the system they requested, not simply a system.

.Talent is surpassed by perseverance. Even though I made a lot of mistakes along the road, I managed to get everything together for Part 3 by persevering.

.Full-stack thinking is necessary while using cloud technologies. Getting the web application to function locally is insufficient; data integrity, scalability, and cloud deployment are equally crucial.

Present Knowledge about Cloud Applications

I now understand the design and development of cloud-based applications on a deeper level. Coding is only one aspect of cloud development; another is comprehension:

- ❑ Deployment pipelines
- ❑ Cloud storage solutions
- ❑ Data management at scale
- ❑ Error handling in a live environment
- ❑ Building for real users

Additionally, I now know how to manage cloud-hosted databases, use Azure services efficiently, create a system that is both practical and easy to use, and organize projects according to best practices.

This project served as my atonement, and I am pleased with the results of this last section. Despite my past mistakes, I've learned a lot and can claim with confidence that I now know what it takes to create, implement, and maintain a cloud-based web service.

Screenshots of azure labs

This is my new Venue table in the query editor

The screenshot shows the Azure Data Studio interface with the title bar "CLDVdb1 (huzz/CLDVdb1) | Query editor (preview)". The left sidebar has sections like "Diagnose and solve problems", "Query editor (preview)" (which is selected), "Security", "Ledger", "Intelligent performance", "Query performance insight", "Help", and "Support + Troubleshooting". The main area shows three tabs: "Query 1", "dbo.Events", and "dbo.Venues" (which is currently active). Below the tabs are buttons for "Create New Row", "Save", "Refresh", "Discard", and "Delete Row". A search bar says "Search to filter items...". The "dbo.Venues" table is displayed with the following data:

VenueId	Name	Location	Capacity	Description	ImageUrl
7	IIE Varsity College	Durban North	8000	University	https://hussblob.blob...
8	Ushaka	Durban	50000	swimming	https://hussblob.blob...
9	hotel	capetwn	-14	hotel	https://hussblob.blob...

This is my my new Eventype table

The screenshot shows the Microsoft Azure Query editor (preview) interface. The top navigation bar includes 'Microsoft Azure', 'Search resources, services, and docs (G+)', 'Copilot', and a user profile. The main title is 'CLDVdb1 (huzz/CLDVdb1) | Query editor (preview)'.

The left sidebar contains a 'Query editor (preview)' tab, which is selected. Other tabs include 'Diagnose and solve problems', 'Security', 'Intelligent performance', 'Query performance insight', 'Help', and 'Support + Troubleshooting'. A note says 'Showing limited object explorer here. For full capability please click here to open Azure Data Studio.'

The central area shows a table named 'dbo.EventType' with the following data:

EventTypeId	Name
1	Wedding
2	Concert
3	Sport
4	Fashion Event
5	Parties
6	Conference

Below the table are buttons for 'Create New Row', 'Save', 'Refresh', 'Discard', and 'Delete Row'. There is also a search bar labeled 'Search to filter items...'. The status bar at the bottom shows 'Query 1', 'dbo.Events', 'dbo.Venues', and 'dbo.EventType'.

This is my new Bookings table with filtering

The screenshot shows the Microsoft Azure CLDvdb1 Query editor (preview) interface. The left sidebar contains navigation links like Home, Login, New Query, Open query, Feedback, and Getting started. Below these are sections for Diagnose and solve problems, Security, Ledger, Intelligent performance, Query performance insight, Help, and Support + Troubleshooting. The main area displays a table titled 'dbo.Bookings' with the following data:

BookingId	ClientName	ClientEmail	NumberOfGuests	EventId	VenuelId
8				11	7
9	zane	zane@gmail.com		11	7

Knowledge about Cloud Application Architecture

My comprehension of developing and implementing cloud applications with Microsoft Azure has greatly increased as a result of this project.

I now know how services like these are used to architect cloud-based systems:

The web application will be hosted via Azure App Service.

Azure SQL Database for safe data storage and querying

GitHub for integration with continuous deployment and code management.

I now know how to:

Use CI/CD pipelines to automatically deploy code.

Create and modify SQL tables to provide new functionality such as filtering,

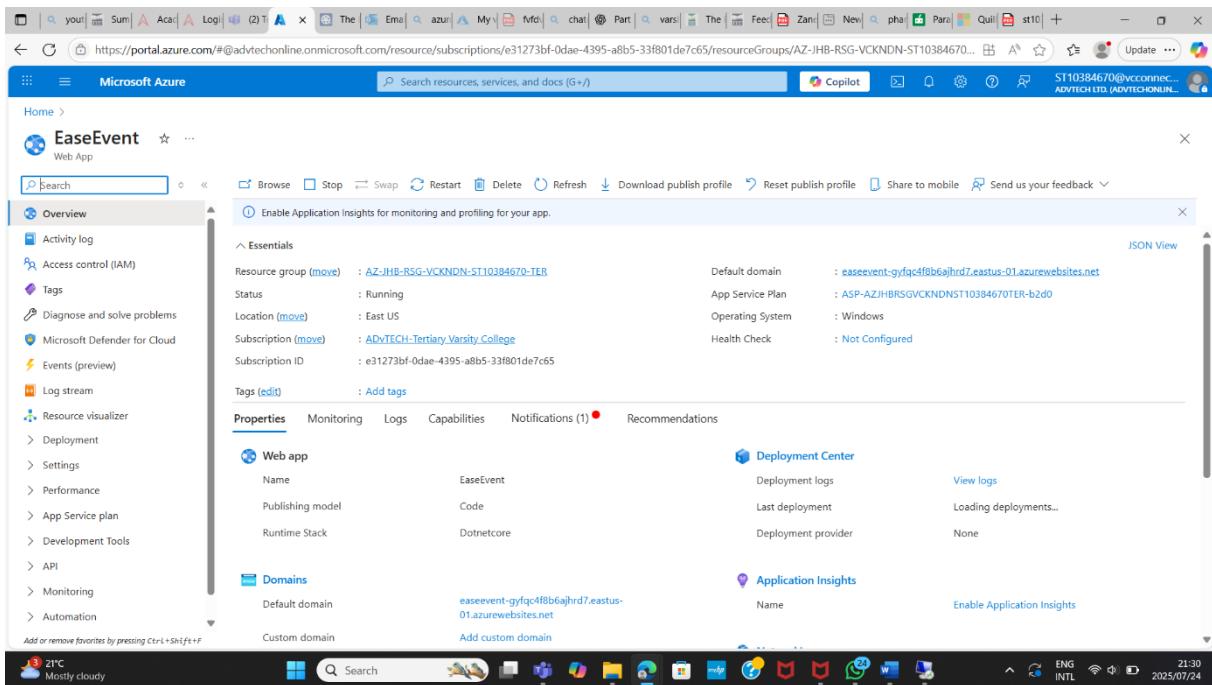

Diagnose deployment faults and resolve problems in various environments.

Create scalable solutions that keep front-end, back-end, and data storage issues apart.

This practical experience has equipped me to work well with others in cloud-based development environments and create future production-ready cloud applications.
